Climate Change Summary, Fort McHenry National Monument and Historic Shrine, Maryland

Patrick Gonzalez

Natural Resource Stewardship and Science, U.S. National Park Service, Washington, DC

January 14, 2015

Climate Trends for the Area within Park Boundaries

- Average annual temperature has increased at a statistically significant rate since 1950 (Table 1, Figure 1). Summer (June-August) temperature has increased at the greatest rate.

- Average total precipitation has increased since 1950, but the rate has not been statistically significant (Table 1, Figure 2). Autumn (September-November) precipitation has increased at a statistically significant rate of 44 ± 20% per century.

- If the world does not reduce emissions from power plants, cars, and deforestation by 40-70%, models project substantial warming and increases in precipitation (Table 1, Figure 3).

- The greatest temperature and precipitation increases could occur in autumn (September-November).

- Projections under the highest emissions scenario project 15-18 more days per year with a maximum temperature >35ºC (95ºF.) and an increase in 20-year storms (a storm with more precipitation than any other storm in 20 years) to once every 5-6 years (Walsh et al. 2014).

Historical Impact in the Region

- Analyses of Audubon Christmas Bird Count data across the United States, including counts in Maryland, detected a northward shift of winter ranges of a set of 254 bird species at an average rate of 0.5 ± 0.3 km per year from 1975 to 2004, attributable to human climate change and not other factors (La Sorte and Thompson 2007).

- Climate change has raised sea level globally and in Chesapeake Bay (See NPS report from Maria Caffrey).
Future Vulnerabilities in the Region

- Under high emissions scenarios, climate change could expand the potential combined ranges of 100 invasive plant and animal species (Bellard et al. 2013).

- Under all emissions scenarios, climate change would continue to raise sea level globally and in Chesapeake Bay (See NPS report from Maria Caffrey).

Table 1. Historical rates of change per century and projected future changes in annual average temperature and annual total precipitation (data Daly et al. 2008, IPCC 2013; analysis Wang et al. in preparation). The table gives the historical rate of change per century calculated from data for the period 1950-2013. Because a rate of change per century is given, the absolute change for the 1950-2013 period will be approximately 60% of that rate. The table gives central values for the park as a whole. Figures 1-3 show the uncertainties.

|	1950-2013	2000-2050	2000-2100
Historical			
temperature	+1.7^{o}C/century (3.1^{o}F./century)		
precipitation	+11%/century		
Projected (compared to 1971-2000)			
Low emissions (IPCC RCP 4.5)			
temperature		+2.2^{o}C (+4°F.)	+2.8^{o}C (+5°F.)
precipitation		+8%	+10%
High emissions (IPCC RCP 6.0)			
temperature		+1.9^{o}C (+3.4^{o}F.)	+3.2^{o}C (+5.8^{o}F.)
precipitation		+7%	+11%
Highest emissions (IPCC RCP 8.5)			
temperature		+2.8^{o}C (+5°F.)	+4.9^{o}C (+8.8^{o}F.)
precipitation		+9%	+14%

Figure 1. Historical annual average temperature for the area within park boundaries. Note that the U.S. weather station network was more stable for the period starting 1950 than for the period starting 1895. (Data: National Oceanic and Atmospheric Administration, Daly et al. 2008. Analysis: Wang et al. in preparation, University of Wisconsin and U.S. National Park Service).

Historical Mean Annual Temperature
Fort McHenry National Monument and Historic Shrine

1895-2010: 13.9 ± 0.8°C
1950-2010: 14.2 ± 0.6°C

Average annual
Five-year running average
Linear trend = 1.7°C century^{-1} (p = 0.0160)

Data: Daly et al. 2008.

Analysis: F. Wang, P. Gonzalez, M. Notaro, D. Vimont, J. W. Williams. in preparation. IPCC AR5 climate projections and exposure assessments for the US National Park System.

Temperature (°C)

Year

Figure 2. Historical annual total precipitation for the area within park boundaries. Note that the U.S. weather station network was more stable for the period starting 1950 than for the period starting 1895. (Data: National Oceanic and Atmospheric Administration, Daly et al. 2008. Analysis: Wang et al. in preparation, University of Wisconsin and U.S. National Park Service).
Figure 3. Projections of future climate for the area within park boundaries. Each small dot is the output of a single climate model. The large color dots are the average values for the four IPCC emissions scenarios. The lines are the standard deviations of each average value. (Data: IPCC 2013, Daly et al. 2008; Analysis: Wang et al. in preparation, University of Wisconsin and U.S. National Park Service).
